# The Mississippi Chronic Illness Coalition

The Mississippi Chronic Illness Coalition (MCIC) was formed in 1996 to work toward improving the long-term health of all Mississippians. The goal of the Coalition is to reduce chronic illnesses that seriously affect the state's population. Comprised of over 140 members statewide, representing 75 public and private organizations, the MCIC encourages you to know your numbers and take charge of your health for a better life.

for a better life

Your cholesterol, blood pressure, blood sugar and body mass index numbers are key indicators of your risk level for having a major illness.

> If you know these numbers, you can take action to reduce your chances of developing heart disease, diabetes, and many other chronic illnesses.

Don't let vour health just happen", know your numbers and take charge for a better life!

# **Cholesterol Target:** 200 or Less

Sometimes the body makes and stores extra fats and cholesterol. A "sudden" heart

attack may not really be sudden at all, but caused by years of living with high cholesterol. The normal range is 200 or less for total

You also need to know your "healthy" HDL cholesterol and "lousy" LDL cholesterol numbers. A high total, LDL, or a low HDL cholesterol number means that you need to take immediate action to prevent potential threats to your health such as a heart attack or stroke.

There are no definite symptoms of high cholesterol. That's why it is important to see your doctor and know your cholesterol numbers.

## **Blood Pressure Target:** 120/80 or Less

Blood pressure is a measure of the amount of force it takes for your heart to pump

blood through your body. High blood pressure increases your risk of having a heart attack, stroke, and for developing kidney disease. It can damage your brain, eyes, and arteries, too. Your blood pressure should be less than

You may have no symptoms that you have high blood pressure. About 60% of all Americans age 60 and over have high blood pressure, and it occurs more often among African Americans. In Mississippi, close to one million people have high blood pressure. Of those, 300,000 don't know they have it.

Anyone can have high blood pressure. Check with your doctor to know your blood pressure numbers.

# **Blood Sugar Target:** 80 to 120

Glucose is sugar in the blood that is the body's main source of energy. If your

glucose is too high or too low, you may have diabetes. The average blood sugar range is 80 - 120.

One out of three people in Mississippi with diabetes don't know they have it or are not being treated. Diabetes can strike people of any age. Diabetes is more common in nonwhite populations. Symptoms may include frequent urination, excessive thirst, extreme hunger, unusual weight loss, increased fatigue, irritability, or blurry vision.

If you have been diagnosed with diabetes, you also need to have your A1C number checked. Your A1C tells how well you are controlling your blood sugar over a three-month period of time. Your A1C should be less than 7.

Diabetes is an extremely dangerous condition when left untreated - it can lead to heart disease, blindness, arm or leg amputations, and kidney disease. That's why it is important to see your doctor and know your blood sugar numbers.

# **Body Mass Index Target:** 25 or Less

Body mass index (BMI) is a measure of your weight in relation to your height. It indicates your "fatness" and should be 25 or less. A number over 25 means you are overweight, and a number over 30 means you are obese. Extra weight can lead to high cholesterol, heart disease, diabetes, and many other chronic illnesses.

Check with your doctor to determine your BMI, then take action to control your weight.

### How Can You Have a Better Life?

Here's how you can take charge of your health for a better life:

- Control your weight,Increase your physical activity,
- Don't use tobacco products,
- · Eat healthy foods, and Know Your Numbers!
